

How to get rid of Red Eye

Here is the original image, a picture of my niece, Katie and my nephew, Daniel. Katie was playing dress up and Daniel decided to join in with his crown. There is some nasty red eye going on here.

I have opened up the image in Photoshop, duplicated the background layer (ALWAYS), then I went into the Channels palette and clicked on the green channel. In this screenshot all of the eyes are visible on the different channels, I just did that so you could see the red portion in Katie's eyes, you will be selecting only the green channel to make your selection from. Just click on the elliptical marquee tool, make sure the Add to Selection box is selected and type 1 px in the Feather range. Make your selection on both eyes and go to Edit>Copy.

Here you are on the blue channel and you go to Edit>Paste Into. Do the same with the red channel.

Here is the finished image, as you can see the red eye is gone. It's a very easy and quick technique!
